

TOWER CHECKER

TAKE CONTROL OF YARD SAFETY...

During yard operations, your RTG drivers can inadvertently create tower stacks that can topple due to high wind or operator negligence. This can lead to damage to yard equipment, or in the worse cases, injury or fatalities.

Tower Checker **Solution**

Tower Checker is a feature in XPS that helps you identify critical stacks that require immediate action and also proactively alert to those stacks that could become problems. The Tower Checker gives your terminal the flexibility to run and scan the entire yard or selected yard.

Control Room **Features**

With Tower Checker, your yard planners can now:

- **Block** such stacks from adding more containers.
- **Mark** containers in those stacks for shifting.
- **Monitor** containers with the Chimney Flag
- **Clear** the tower flag after containers are shifted out.

Control Room **Key Benefits**

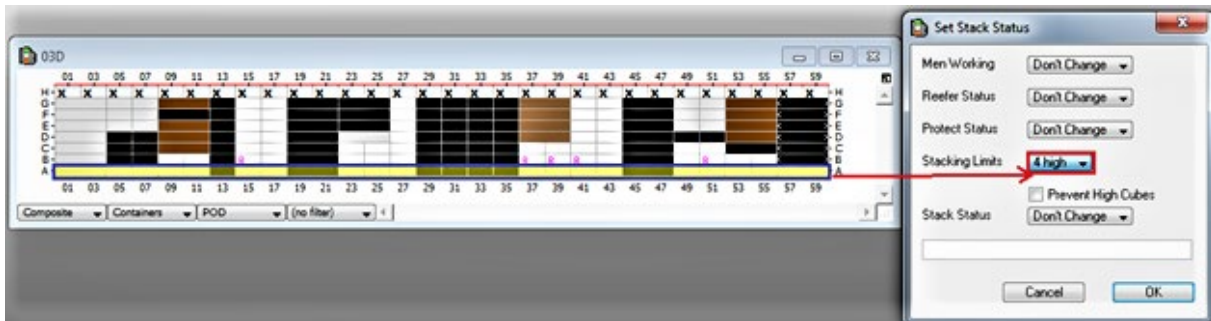

Easy to configure

Fully integrated with XPS Recap tools

No impact on application performance and stability.
